THE REGIONAL PROFILE DATA BASE

JAMES J. TUCCILLO

MARCH 1988

THIS IS AN UNREVIEWED MANUSCRIPT, PRIMARILY INTENDED FOR
INFORMAL EXCHANGE OF INFORMATION AMONG NMC STAFF MEMBERS

THE REGIONAL PROFILE DATABASE

James J. Tuccillo
Development Division
National Meteorological Center
7 November 1987

I. INTRODUCTION

The Regional Profile Database is a VSAM based random access database of NGM forecast sigma layer and diagnostic data at selected locations over North America. This database was designed as the basis for generating new model products which are not possible with the normal 12 hour gridded fields on pressure surfaces. Meteograms (time histories), soundings and other products are available for operational and R&D use. This TPB will describe the contents of the database, how to access it and present a few examples of products from the database.

II. CONTENTS OF THE DATABASE

The database has two components :

- PROFOPN

- PROFSYN

They have different characteristics based on their anticipated use and are described below.

a) PROFOPN

This component of the database contains the entire NGM sigma layer specification of momentum, temperature, pressure and moisture as well as many other diagnostic quantities at a network of station over North America. These qualities are derived via bi-linear interpolation from the model grids to the station latitude and longitude. The information is stored with a time frequency of 1 hour and is available for the latest 18 cycles (or 9 days). The WMO station number, latitude and longitude, 3 letter identifier and descriptive name of the 181 stations in the network is presented in Table 1. Figure 1 shows the geographical distribution of the stations. All reasonable requests for additions to the list of stations will be honored within 24 hours.

There are 49 profiles (0 hour plus every hour out through 48 hours) available every cycle. Since there are 181 stations for the latest 18 cycles of the RAWS the total number of profiles is

$$49 * 181 * 18 = 159,642.$$

This component of the database has a high temporal resolution which allows for detailed examination of the forecast. The length of the database (9 days) is such that post mortems of significant weather events is possible without having to rerun the NGM.

b) PROFSYN

This component of the database contains the profiles at the same network of station as PROFOPN except the information is stored every 12 hours out through 48 hours. The information is available for the latest 72 cycles (36 days) as opposed to the 18 cycles of PROFOPN. The number of profiles is therefore

$$5 * 181 * 72 = 65,160.$$

Since verification in the form of a 00 hour forecast is available only every 12 hours, this component of the database is used for verifying the NGM forecast of length 12, 24, 36 and 48 hours. With 36 days online, monthly summaries of the performance of the NGM at any of the 181 stations in the database is possible.

III. ACCESSING THE DATABASE - RETRIEVAL OF RAW NUMBERS

Access to the database, through the NMC NAS 9000 computer system, for the purpose of retrieving the actual forecast values is made possible through a series of subroutines. The current library of routines will undoubtedly grow and updated versions of this document will be prepared. Currently, the following routines are available.

- 1) GUVTQP - returns the 16 sigma layer values of zonal and meridional wind, temperature, specific humidity and pressure and the surface pressure, surface elevation and skin temperature.
- 2) GCLDS - returns the fractional coverage of low, middle and high clouds and the pressure of the sigma layer

where they are present from the interactive cloud model in the NGM.

- 3) GRDTN - returns the 16 sigma layer values of total radiational heating.
- 4) GPRCP - returns the accumulated grid scale and sub-grid scale precipitation over the past hour.
- 5) GSEB - returns the terms of the surface energy budget and the skin and sub-soil temperatures from the surface energy budget in the NGM.

These subroutines are called by supplying the year, month, day, and hour that the forecast was initialized plus the forecast hour and station number. The information listed above plus an error flag is returned. Detailed descriptions of the calling sequence plus the physical units of the returned quantities are presented in Appendix A (see TPB #363 for details regarding radiation and other physical processes in the NGM). Appendix B provides information on the structure of the VSAM files.

The following program and JCL demonstrates how to retrieve the sigma layer values of wind, temperature, moisture and pressure as well as surface pressure, terrain elevation and skin temperature using GUVTQP. This job is setup for an user onsite at NMC and must run on the NAS 9000 computer system: the location of the database. Remote users of the NAS 9000 system will need to adjust the JCL appropriately.

```
//WWXXX   JOB ( XXXXXXXXXX,XXXXXXX),YOURNAME,  
//           MSGCLASS-T,MSGLEVEL-(2,0),  
//           NOTIFY=$WDXXXX,  
//           TIME=2,REGION=1500K  
//**FORMAT  PR,DDNAME=.DEST=NASJS3.WWB37  
//*  
//*      THIS JOB DEMONSTRATES HOW TO USE SUBROUTINE GUVTQP  
//*      TO RETRIEVE AN NGM FORECAST SOUNDING  
//*

C END IF
C
C AT THIS POINT ARRAYS U, V, T, Q, P HOLD THE 16 SIGMA LAYER VALUES
C FOR A 17 HOUR FORECAST AT DULLES
C
C ***** CODE TO PROCESS THE INFORMATION *****
C
C STOP
C END
/*
*/
/* LINK EDIT THE NEEDED SUBROUTINES
*/
//LKED.MYLIB DD DSN-NWS.WD22.JJT.REG.LOADLIB, DISP-SHR
//LKED.SYSIN DD *
INCLUDE MYLIB( RPACODE )
ENTRY MAIN
/*
*/
```

```
/* UNIT 99 IS THE VSAM DATASET
/*
//GO.FT99K01 DD DSN=NWS.WD22.JJT.REG.PROFOPN.CLUSTER,DISP=SHR
//
```

During the LINK EDIT step, you must include member RPACODE from the following load library.

NWS.WD22.JJT.REG.LOADLIB.

This member contains the object code for the routines to read the database.

During the GO step you must define unit 99 as the database dataset. For the two components of the database listed above the datasets are

NWS.WD22.JJT.REG.PROFOPN.CLUSTER

NWS.WD22.JJT.REG.PROFSYN.CLUSTER.

Choose one or the other depending on your need. In the above example the hourly component, PROFOPN, is used.

IV. ACCESSING THE DATABASE - NMCIIDAS GRAPHICS

Graphical display of the raw data in the database is possible through the NMCIIDAS graphics package of Development Division. Meteograms (time histories), time/height crossections and sounding plots are available at any of the 181 stations in the database. Figures 2 - 5 present examples of the output. Appendix C contains the documentation of the NMCIIDAS commands relative to the database. Additional information is available from the Development Division. (This capability is available to those physically located in the World Weather Building).

V. ACCESSING THE DATABASE - VDUC

Those users on the VDUC loop may access the database through a series of VDUC commands which have been developed in the Development Division of NMC. These commands are evolving rapidly and interested individuals should contact Development Division for the most recent versions of the commands.

VI. ACCESSING THE DATABASE - PC PLOTTING PROGRAM

Remote sites with access to the NMC NAS 9000 system can easily access the database and plot soundings using a plotting package developed for an IBM PC or MS DOS compatible clone. The general procedure would be to logon the NAS 9000 system and run an existing program in TSO foreground to extract the vertical profiles of wind, temperature, moisture and pressure from the database for the desired forecast. This information would be downloaded to a PC and the sounding program would be executed on the PC to plot the soundings either on the CRT or line printer. A documentation of the program is included in Appendix D. A demonstration disk of the sounding plotting program with several data file from a recent NGM forecast is available upon request.

APPENDIX A

DESCRIPTION OF THE ROUTINES TO ACCESS THE ARCHIVE

In this section, the calling sequence of the routines to access the archive are presented.

* SUBROUTINE GUVTOP (IYR, IMN, IDY, IHR, ISTA, IFHR, IVERF,
* U,V,T,Q,P,PSTAR,TSKIN,TERR,ALAT,ALON,NZ,IERR)

NAME : GUVTOP
PURPOSE : RETURN U,V,T,Q, AND P INFORMATION
AUTHOR : J. J. TUCCILLO
DATE : 06 JULY 1987

THE INPUT ARGUMENTS ARE :

IYR	-	YEAR
IMN	-	MONTH
IDY	-	DAY
IHR	-	CYCLE
ISTA	-	BLOCK AND STATION NUMBER (EG. 72403 FOR DULLES)
IFHR	-	FORECAST LENGTH IN SECS OR HOURS
IVERF	-	= 0, FORECAST ORIGINATING AT IYR, IMN, IDY, IHR 1, FOREACST VERIFYING AT IYR, IMN, IDY, IHR

THE OUTPUT ARGUMENTS ARE :

U(NZ)	-	EAST-WEST WIND COMPONENT	< M/S
V(NZ)	-	NORTH-SOUTH WIND COMPONENT	< M/S
T(NZ)	-	TEMPERATURE	< DEGREES K
Q(NZ)	-	SPECIFIC HUMIDITY	< GRMS/GRM
P(NZ)	-	PRESSURE AT LAYER MIDPOINT	< MB
PSTAR	-	TERRAIN PRESSURE	< MB
TSKIN	-	SKIN TEMPERATURE	< DEGREES K
TERR	-	TERRAIN HEIGHT	< METERS
ALAT	-	LATITUDE	< DEGREES
ALON	-	LONGITUDE	< DEGREES
NZ	-	NUMBER OF LAYERS RETURNED	
IERR	-	= 0, RECORD FOUND 1, RECORD NOT FOUND 2, BACKDATE IS NOT AN INCREMENT OF 12 3, ERROR OPENING THE ARCHIVE 4, ERROR READING THE ARCHIVE	

END END END OF DOCUMENTATION

SUBROUTINE SPROP (IYR, IMN, IDY, IHR, ISTA, IFHR, IVERF,
* GSP, SGSP, ALAT, ALON, NZ, IERR)

NAME : SPROP
PURPOSE : RETURN PRECIPITATION INFORMATION
AUTHOR : J. J. TUCCILLO
DATE : 06 JULY 1987

THE INPUT ARGUMENTS ARE :

IYR	YEAR
IMN	MONTH
IDY	DAY
IHR	CYCLE
ISTA	STATION INDEX
IFHR	FORECAST LENGTH IN SECONDS OR HOURS
IVERF	= 0, FORECAST ORIGINATING AT IYR, IMN, IDY, IHR = 1, FORECAST VERIFYING AT IYR, IMN, IDY, IHR

THE OUTPUT ARGUMENTS ARE :

IDIF = 1

GSP	IDIF HOUR ACC GRID SCALE PR (METERS)
SGSP	IDIF HOUR ACC SUB-GRID SCALE PR (METERS)
ALAT	LATITUDE (DEGREES)
ALON	LONGITUDE (DEGREES)
NZ	NUMBER OF LAYERS RETURNED
IERR	= 0, RECORD FOUND = 1, RECORD NOT FOUND = 2, BACKDATE IS NOT AN INCREMENT OF 12 = 3, ERROR OPENING THE ARCHIVE = 4, ERROR READING THE ARCHIVE

END END END OF DOCUMENTATION

SUBROUTINE GOLDS (IYR, IMN, IDY, IHR, ISTA, IFHR, IVERF,
* ALA, AMA, AHA, ALW, AMW, AHW, ACA, ACWB, ACWT, ALAT, ALON, NZ, IERR)

NAME : GOLDS
PURPOSE : RETURN CLOUD INFORMATION
AUTHOR : J. J. TUCCILLO
DATE : 06 JULY 1987

THE INPUT ARGUMENTS ARE :

IYR	YEAR
IMN	MONTH
IDY	DAY
IHR	CYCLE
ISTA	STATION INDEX
IFHR	FORECAST LENGTH IN HOURS OR SECONDS
IVERF	= 0, FORECAST ORIGINATING AT IYR, IMN, IDY, IHR = 1, FORECAST VERIFYING AT IYR, IMN, IDY, IHR

THE OUTPUT ARGUMENTS ARE :

ALA	LOW CLOUD AMOUNT
AMA	MID CLOUD AMOUNT
AHA	HIGH CLOUD AMOUNT
ALW	LOW CLOUD PRESSURE
AMW	MID CLOUD PRESSURE
AHW	HIGH CLOUD PRESSURE
ACA	CONVECTIVE CLOUD AMOUNT
ACWB	PRESSURE AT BASE OF CLOUD
ACWT	PRESSURE AT TOP OF CLOUD
ALAT	LATITUDE
ALON	LONGITUDE
NZ	NUMBER OF LAYERS RETURNED
IERR	= 0, RECORD FOUND = 1, RECORD NOT FOUND = 2, BACKDATE IS NOT AN INCREMENT OF 12 = 3, ERROR OPENING THE ARCHIVE = 4, ERROR READING THE ARCHIVE

END END END OF DOCUMENTATION

* SUBROUTINE GSSEB (IYR, IMN, IDY, IHR, ISTA, IFHR, IVERF,
* ASWR, ALWR, ASHF, ALHF, ASSE, TSKIN, TSUB, ALAT, ALON, NZ, IERR)

NAME : GSSEB
PURPOSE : RETURN SURFACE ENERGY BUDGET INFORMATION
AUTHOR : J. J. TUCCILLO
DATE : 06 JULY 1997

THE INPUT ARGUMENTS ARE :

IYR	=	YEAR	
IMN	=	MONTH	
IDY	=	DAY	
IHR	=	CYCLE	
ISTA	=	STATION INDEX	
IFHR	=	FORECAST LENGTH IN HOURS OR SECONDS	
IVERF	=	0: FORECAST ORIGINATING AT IYR, IMN, IDY, IHR 1: FORECAST VERIFYING AT IYR, IMN, IDY, IHR	

THE OUTPUT ARGUMENTS ARE :

ASWR	=	SHORTWAVE RADIATION	(W/M**2)
ALWR	=	NET LONGWAVE RADIATION	(W/M**2)
ASHF	=	SENSIBLE HEAT FLUX	(W/M**2)
ALHF	=	LATENT HEAT FLUX	(W/M**2)
ASSE	=	SUB-SOIL FLUX	(W/M**2)
TSKIN	=	SKIN TEMPERATURE	(DEGREES)
TSUB	=	SUB-SOIL TEMPERATURE	(DEGREES)

* SUBROUTINE GRTDN (IYR, IMN, IDY, IHR, ISTA, IFHR, IVERF,
* RADN, ALAT, ALON, NZ, IERR)

NAME : GRTDN
PURPOSE : RETURN RADIATION HEATING RATES
AUTHOR : J. J. TUCCILLO
DATE : 06 JULY 1997

THE INPUT ARGUMENTS ARE :

IYR	=	YEAR	
IMN	=	MONTH	
IDY	=	DAY	
IHR	=	CYCLE	
ISTA	=	STATION INDEX	
IFHR	=	FORECAST LENGTH IN SECONDS OR HOURS	
IVERF	=	0: FORECAST ORIGINATING AT IYR, IMN, IDY, IHR 1: FORECAST VERIFYING AT IYR, IMN, IDY, IHR	

THE OUTPUT ARGUMENTS ARE :

RADN(NZ) =	TOTAL RADIATIVE HEATING	(DEG K/DAY)	
ALAT	=	LATITUDE	(DEGREES)
ALON	=	LONGITUDE	(DEGREES)
NZ	=	NUMBER OF LAYERS RETURNED	
IERR	=	0: RECORD FOUND 1: RECORD NOT FOUND 2: BACKDATE IS NOT AN INCREMENT OF 12 3: ERROR OPENING THE ARCHIVE 4: ERROR READING THE ARCHIVE	

END END END OF DOCUMENTATION

APPENDIX B

STRUCTURE OF THE ARCHIVE

The archive is based on a VSAM keyed access file structure with each record representing one profile. The records are inserted into and retrieved from the file based on the first 12 bytes of the record ; the key. The key, by definition, is unique for each record. The remainder of the record represents data ; the latitude, longitude, winds, temperature, moisture, pressure etc. The record structure is presented below :

BYTES	DESCRIPTION	REPRESENTATION
1 - 4	Initialization Time	Packed IBM Integer*4
5 - 8	Forecast Time in Secs	IBM Integer*4
9 - 12	WMO Station Number	IBM Integer*4
13 - 16	Station Latitude	IBM Real*4
17 - 20	Station Longitude	IBM Real*4
21 - 604	Forecast Values	IBM Real*4

The structure of the forecast values in bytes 21 - 604 will not be presented here. The structure of the data within these bytes is based on the organization of arrays within the NGM code. Since the internal structure of the NGM changes from time to time, the organization of values within bytes 21 - 604 will also change. The user need only be aware of the fact that the subroutines presented in Appendix A do the actual decoding of the records and will be updated and recompiled for the load library when ever necessary.

APPENDIX C

COMMAND: Plot Sounding

KEY-IN: PS

PROGRAMMER: D. W. Plummer

DATE: 13 JUL 87

COMMAND FORMAT:

DOC BY: programmer

PS STATION TYPE PSPEC KOLOR DSI TIMPER

EXPLANATION:

This command is used for plotting an atmospheric sounding. Up to two soundings may be plotted on either a skew-T or Stuve diagram. The plotted data may be from the NMCIDAS observed data database, model output from the profile archives or from an unformatted file.

PARAMETER DESCRIPTION:

STATION - the block and station number or three letter identifier of the forecast station.

TYPE - type of diagram, either SKEWT or STUVE.

PSPEC - panel specification, either 11 or 12 or 22

- 11 - one sounding only
 - temperature will be solid;
 - dew point will be dashed.
 - winds labelled as 1.
- 12 - the first of 2 soundings
 - both temperature and dew point will be solid.
 - winds labelled as 1.
- 22 - the second of two soundings
 - both temperature and dew point will be dashed.
 - winds labelled as 2.

KOLOR - color of temperature, dew point and winds

DSI - data set index

- 11 - observed data sounding
- 5x - model output sounding from profile archives.
model run and time defined by DD command.
- 91 - unformatted file data in unit 91
This file should have a record length of 80 with the records containing (unformatted):

COMMAND: PS (continued)

RECORD - INFORMATION (I-integer,R-real)

- 1) station(I), latitude(R), longitude(R)
- 2) NZ (I, number of levels)
- 3) u(R), v(R), t(R), td(R), p(R), z(R) for level 1
- 4) u(R), v(R), t(R), td(R), p(R), z(R) for level 2
- .
- .
- NZ+2) u(R), v(R), t(R), td(R), p(R), z(R) for level NZ

TIMPER - time period of observed data sounding from NMCIDAS database.

EXAMPLES:

GD ARCH 87 7 14 00 1

- stages observed data from 00Z 14 Jul 1987 to the NMCIDAS observed data database first time period.

PS 72403 SKEWT 11 3 11 1

- plots the Dulles sounding for 00Z 14 Jul 1987.

DD 51 ARCH RAFX 87 7 13 00 12

PS 72403 SKEWT 11 3 51

- plots the Dulles sounding for 12Z 13 Jul 1987 as forecast by the parallel regional cycle starting 00Z 13 Jul 1987.

DD 51 ARCH RAFX 87 7 13 00 24

PS 72403 SKEWT 12 3 51

- plots the Dulles sounding for 00Z 14 Jul 1987 as forecast by the parallel regional cycle starting 00Z 13 Jul 1987.

DD 52 ARCH RAFX 87 7 13 12 12

PS 72403 SKEWT 22 3 52

- plots the Dulles sounding for 00Z 14 Jul 1987 as forecast by the parallel regional cycle starting 12Z 12 Jul 1987.
Both plots will appear on the same thermodynamic diagram.

PS 72403 SKEWT 11 3 91

- plots a generic sounding from unit 91.

COMMAND: Meteogram

KEY-IN: MG

PROGRAMMER: D. W. Plummer

DATE: 13 JUL 87
DOC BY: programmer

COMMAND FORMAT:

MG STATION DSI NPARMS T1 L1 T2 L2 ... Tnparms Lnparms

EXPLANATION:

This command is used for plotting a meteogram forecast from one of the model profile archives. The profile archives contain sigma level u,v,t,q and p as well as many surface quantities. Several diagnostic variables are available as well. The data may be plotted as a single level time series or as a multi-level time section.

PARAMETER DESCRIPTION:

STATION - the block and station number or three letter identifier of the forecast station.

DSI - dataset index specifying the model run and starting date.

NPARMS - the number of parameters (Tn and Ln combinations) to be included in the diagram.

Tn - type specifiers

Ln - level specifiers

The following types are available for the following levels (level definitions follow):

TYPE	DESCRIPTION / VALID LEVELS
U	u-component (m/s) isl,ALL,TROP,thick
V	v-component (m/s) isl,ALL,TROP,thick
T	dry temperature (C) isl,SFC,ALL,TROP,thick
Q	specific humidity (g/kg) isl,ALL,TROP,thick
P	pressure (mb) SFC,MSL,ALL,TROP,thick
VEL	wind speed (m/s) isl,ALL,TROP,thick
RH	relative humidity (%) isl,ALL,TROP,thick

COMMAND: MG (continued)

POT potential temperature (K)
 isl,ALL,TROP,thick
TD dew point temperature (C)
 isl,ALL,TROP,thick
TDEP dew point depression (C)
 isl,ALL,TROP,thick
DIR wind direction (graphic)
 isl,ALL,TROP,thick
QS saturation specific humidity (g/kg)
 isl,ALL,TROP,thick
WNDF wind flag (graphic,m/s)
 isl,ALL,TROP,thick
RADN radiational heating rate (C/day)
 isl,ALL,TROP,thick
APCP accumulated total precipitation (mm) - bar chart
 hour increment
ACPP accum. convective precip. (mm) - bar chart
 hour increment
NCPP accum. non-conv. precip. - bar chart
 hour increment
PFCT ratio of conv. precip. to total (%) - bar chart
 hour increment
CLDL cloud amount, low (%) - bar chart
 any
CLDM cloud amount, middle (%) - bar chart
 any
CLDH cloud amount, high (%) - bar chart
 any
SWR short wave radiation (W/m**2)
 any
LWR long wave radiation (W/m**2)
 any
SHF sensible heat flux (W/m**2)
 any
LHF latent heat flux (W/m**2)
 any
SLF soil flux (W/m**2)
 any
TSS subsoil temperature
 any
SEB surface energy budget (W/m**2)
 (SWR & LWR & SHF & LHF & SLF)
 any
TSSK TSS & T SFC (skin)
 any

COMMAND: MG (continued)

LEVEL DEFINITIONS:

- isl - individual sigma level. This results in a time series.
($1 \leq \text{isl} \leq \text{NZ}$)
where NZ is the total number of model sigma levels.
- SFC - surface. For surface quantities only.
- MSL - mean sea level. For pressure only.
- ALL - all vertical levels. This results in a time section with vertical range from 1050 mb to sigma level NZ.
- TROP - all vertical levels to the tropopause. This results in a time section with vertical range from 1050 mb to 200 mb.
- thick - all vertical levels bounded by the pressure levels specified by thick.
 $\text{thick} = \text{LL}*10 + \text{UL}/10$
where LL is the lower level in mb
and UL is the upper level in mb.
- any - anything, but something must be specified.
(INFO works well)

EXAMPLES:

DD 51 ARCH RAFX 87 7.13 00

MG 72403 51 1 T 1

- plots a time series of the first sigma level temperature.

MG 72403 51 6 T 6 T 5 T 4 T 3 T 2 T 1

- plots 6 time series of the lowest 6 sigma level temperatures.

MG 72403 51 1 T SFC

- plots a time series of the surface (skin) temperature.

MG 72403 51 1 P MSL

- plots a time series of mean sea level pressure.

MG 72403 51 1 VEL ALL

- plots a time section of wind speed for all levels.

MG 72403 51 1 POT TROP

- plots a time section of potential temperature from 1050 mb to 200 mb.

COMMAND: MG (continued)

MG 72403 51 2 PDT TROP WNDF TROP

- plots time sections of potential temperature and wind flags from 1050 mb to 200 mb.

MG 72403 51 1 RH 10050

- plots a time section of relative humidity from 1000 mb to 500 mb.

MG 72403 51 1 APCP 3

- plots a time series of accumulated precipitation at 3 hour intervals.

MG 72403 51 1 ACPP 6

- plots a time series of accumulated convective precipitation at 6 hour intervals.

MG 72403 51 1 PPCT 12

- plots a time series of convective precipitation percentage at 12 hour intervals.

MG 72403 51 1 CLDL INFO

- plots a time series of low cloud amount (bar graph).

MG 72403 51 3 CLDH INFO CLDM INFO CLDH INFO

- plots 3 time series of high, middle and low cloud amounts.

MG 72403 51 6 SWR INFO LWR INFO SHF INFO LHF INFO SLF INFO

- plots 6 time series of radiation parameters.

MG 72403 51 1 TSSK INFO

- plots overlayed time series of skin temperature and subsoil temperature.

MG 72403 51 1 PTV TROP

- plots overlayed time sections of potential temperature and wind speed.

MG 72403 51 1 PTVQ 10050

- plots overlayed time sections of potential temperature, wind speed and specific humidity from 1000 mb to 500 mb.

APPENDIX D

A PC BASED SYSTEM FOR PLOTTING NGM FORECAST SOUNDINGS

James J. Tuccillo
National Meteorological Center
World Weather Building
W/NMC22, Room 204
Washington, D. C. 20233

NOTE : IF THIS DOCUMENTATION DOES NOT INCLUDE A DEMO FLOPPY DISK
THEN WRITE ME AT THE ABOVE ADDRESS FOR A COPY.

I. INTRODUCTION

This document and the enclosed floppy disk will demonstrate an IBM PC, or clone, based sounding plotting program for the interactive plotting of Nested Grid Model (NGM) forecast soundings at a time frequency of 1 hour or greater. The current NWS displays systems, AFOS and FAX, do not allow for the display of vertical profiles of wind, temperature and moisture. This system will allow one to display these quantities on an Emagram. The enclosed floppy disk contains the software for plotting soundings and a data file from a recent NGM forecast. This is for demonstration purposes. A procedure for using this capability in real time will be suggested in Section 3.

II. RUNNING THE DEMONSTRATION

To use this system you will need the following equipment:

- an IBM PC or XT or clone with at least 256K of memory
- MS-DOS Operating System
- printer if you want hard copies.

The enclosed floppy disk contains the following files:

- SND SLOW .EXE
- SND FAST .EXE
- DULLES

The first two files are the executable sounding plotting programs. If your system has an 8087 math co-processor use SND FAST .EXE otherwise use SND SLOW .EXE. The second file is a data file for Dulles, Va. The current operational profile archive has 181 stations, Dulles is provided for demonstration purposes.

After booting the system place the demonstration disk in the 'A' drive if you have a system with a hard disk or in the 'B' drive if you have a 2 floppy drive system. Set the drive to either 'A' or 'B' as appropriate. Turn on your printer if you want hard copy.

To begin execution type either SNDFAST or SND SLOW (depending on whether you have an 8087 co-processor or not). At this time a display panel should appear on the CRT. If I lose you or it doesn't seem to be working call me at 301-763-8161. Hit return and the next display screen will ask you for a data file. Type in the name of one of the above data files and hit return.

Use upper case letters for this and all other input. Next you will be prompted for whether you want to plot on the screen ('S') or the printer ('P'). If you selected 'P', the printer, you will be prompted for the type of printer you have available. Enter the number from the list displayed. Plotting on the screen may not work depending on your CRT, plotting on the printer should work for everyone. You will now start to see messages displayed on the CRT indicating that sounding information is being loaded off disk into memory. When it is done it will prompt you with the following :

> (Q=QUIT,M=MENU,P=PLOT)

Type 'M' and a menu of the available data in the data file you selected will be displayed. The menu may scroll off the screen, type 'CTRL-S' to stop and start the scrolling. The number in the first column is how you select which sounding you wish to plot. The year, month, day, and hour of initialization, the WMO block and station number and the forecast hour follow.

Type 'P' to plot a sounding. You will be prompted for one of the numbers displayed in the first column of the menu display. This is how you indicate which sounding you wish to plot. A 'Please wait...' message will be displayed while the plotting instructions are being generated. When it is done it will display another prompt

> (Q=QUIT,M=MENU,P=PLOT)

Type 'P' again to generate the plotting instructions for another sounding, or 'M' if you need to see the menu again. You will continue to receive a prompt until you type 'Q'

The actual plotting on the screen or printer will take place when you type 'Q' for quit. Typing 'P' generates plotting instructions and stores them on disk. You can generate as many soundings as you wish but they will not be plotted

on the screen or printer until you end execution of the program by typing Q
when the prompt appears.

A sample plot is presented on the following page. The thin solid line is the temperature profile, the thin dashed line is the dewpoint profile, and the wind vectors in knots (earth coordinates) are on the right hand side. The tempefature, dewpoint, and winds are the actual sigma layer values of the NGM. There is no interpolation to pressure. You are seeing the actual model representation of these quantities. The heights of the mandatory pressure surfaces, derived by vertically integrating the sigma layer temperatures to the pressure surfaces, are displayed on the right. At the top of the plot is the year, month, day and hour that the model was initialized on and the forecast hour. For example a 12 hour forecast initialized on 2 June 1987 at 12Z would be valid at 3 June 1987 at 00Z.

At the bottom of the plot the surface pressure (pressure at the terrain of the model), the skin temperature from the surface energy budget (see TPB # 363 for details), the first sigma layer temperature (mean temperature of the bottom 35mbs of the NGM) and the Lifted Index are printed. The Lifted Index is computed by lifting a parcel with the average temperature and specific humidity of the lowest 75mb of the NGM and may differ from the 'Best Lifted Index' displayed on AFOS and FAX.

III. SUGGESTED PROCEDURE FOR REAL TIME USE

This program could be used in real time if the user has access to the NMC computers. You would need a modem and communications software (which is readily available). The procedure would be as follows:

- 1) Logon to the NMC mainframe
- 2) Execute an existing program to create a file of sounding data.
- 3) Download that file to your PC
- 4) Logoff the NMC mainframe
- 5) Execute SNDFAST (or SNDslow) on the downloaded data

Some of the communications software is "smart" enough that they can be setup to execute the above steps automatically.
